Guidance for Re-opening and Maintaining Safe Gym and Fitness Center Operations Amid the COVID-19 Pandemic

Wednesday, June 24 at 1 pm ET
How it spreads

- The virus is thought to spread mainly from person to person.
  - Between people who are in close contact with one another (within about 6 feet).
  - Through respiratory droplets produced when an infected person coughs, sneezes, or talks.
- These droplets can land in the mouth or nose of people who are nearby or possibly be inhaled into the lungs.
- COVID-19 may be spread by people who are not showing symptoms.
How it spreads (con’t)

- The virus that causes COVID-19 is spreading very easily and sustainably between people.
- Information from the ongoing COVID-19 pandemic suggests that this virus is spreading more efficiently than influenza, but not as efficiently as measles, which is highly contagious.
- The virus may be spread in other ways.
  - It may be possible that a person can get COVID-19 by touching a surface or object that has the virus on it and then touching their own mouth, nose, or possibly their eyes.
  - This is not thought to be the main way the virus spreads, but we are still learning more about how this virus spreads.
